

December 1, 2011.

All of the data and the programs needed to replicate the results in the Chodorow-Reich, Feiveson, Liscow, and Woolston are included here.

The file structure must be preserved in order to run.

The main folder includes 5 items:

1) The MasterFile.do, if run, will produce all of the tables. To run MasterFile.do one must fill in the directory in which this file is contained where it says:

```
global dir = "<FILL IN THE MAIN DIRECTORY PATH HERE>"
```

2) The data folder contains all of the data used. The documentation of the data is included within that folder.

3) The programs folder contains all of the do-files that the MasterFile.do calls to produce the results in the table. Each do-file can be run independently once the following code has been run:

```
global dir = "<FILL IN THE MAIN DIRECTORY PATH HERE>"
```

4) The output folder contains all of the output produced by running the MasterFile.do. The tables are in text format, and the figures are in stata .gph and .emf formats.

5) This README text file.
