

Description of Programs and Data Sets for
“Tax Sensitivity and Home State Preferences in Internet Purchasing”
AEJPol-2007-0029

Aggregate state-level analysis

Input data sets: streg128.dta (state-level sales of 128MB memory modules, Stata 7 format), streg256.dta (state-level sales of 256MB memory modules, Stata 7 format), StateChar.csv (state-level covariates), stlevel3.csv (additional state-level covariates)

Program: stregrs.do (program written in Stata 7 which takes the above four input data sets, computes the summary statistics in Table 1, and estimates the state-level regressions in Table 2)

Discrete-choice analysis

Since the discrete choice analysis is somewhat computer-intensive, we have separated the analysis into five different programs. One program computes the summary statistics in Table 3 and the other four estimate the discrete choice models in Table 4, one program for each column (i.e., 128MB PC100, 128MB PC133, 256MB PC100, 256MB PC133). Each of the four programs takes its own input data set.

Input data sets: nldata1280.dta, nldata1283.dta, nldata2560.dta, nldata2563.dta (disaggregate sales data for each of the four products we use, all Stata 8 format)

Programs: nlstats.do (program written in Stata 8 which takes all four input files above and computes the summary statistics in Table 3), nl1280.do, nl1283.do, nl2560.do, nl2563.do (programs written in Stata 8, which each take the corresponding input file and estimate the discrete-choice models of demand in Table 4)
