

readme-base.txt

Sub-directories are as follows

/gis: Contains results of GIS software spatial merges and do-files that process these data sets
/data: Contains a series of sub-directories each with different input data sets. Data sets used for empirical analysis

are saved in this directory/

/ccdb: City county data book data

/cen90: Some stf3 1990 census data (extracted from Geolytics)

/cenpan: 1960, 1970, 1980 and 1990 stf4 census data

/check: alternative tracts 1960 data set used to check allocation assumptions

/district70: Census district data from 1970

/district80: Census district data from 1980

/district90: Census district data from 1990

/handenter: Hand entered data from the 1960 census

/ipums: 1960 census micro data

/welch_ccd: Common core of data on district student composition and Welch/Light desegregation

data

/xwalk: Data sets and do-files that generate crosswalks between various geographies and coding schemes

/programs: Contains two important do-files that build the data

/tables: Contains the do-files that create output for tables and figures

To build the data sets, the do-files should be run in the following order

/gis/cln-seggis-all.do: Allocates tracts in all years to school district geographies using unclipped tracts

/gis/cln-seggisx.do: Allocates tracts in all years to school district geographies using tracts clipped to 1970 tracted areas

/programs/build-districts.do: Builds a district level data set with information on desegregation and student demographics

/programs/panel-censux.do: Combines resulting data sets from the above three do-files into

tractpanx.dta: used for spatially disaggregated analysis within central districts

dis70panx.dta: which is used for district/time level analysis

The do-files in the tables directory are named to match the tables and figures in the paper. Some of them generate .out

files which have regression output.
