

Guide to Data and Programs for
Factor Immobility and Regional Impact of Trade Liberalization: Evidence from India

Author: Petia Topalova

There are 8 datasets needed to replicate the results in the manuscripts. All dataset are in STATA format.

Rural_data.dta: This is the main dataset of the paper. The unit of observation is district / survey round in the RURAL sample of the NSS surveys. It contains district levels measures of poverty, tariffs (scaled and unscaled), and other variables used in the paper. It is used to generate Tables 1, 2, 3a, 5, 6, 8 and Web Appendix Tables 1 and 2.

Rural_region_data.dta: This dataset is similar to rural_data.dta but the unit of observation is region/survey round in the RURAL sample of the NSS surveys. It is used to generate Table 3a, columns 5 and 6, Table 6, Panel B, and Appendix Table 1, columns 1-3.

Urban_data.dta: This dataset is similar to rural_data.dta but the unit of observation is region/survey round in the URBAN sample of the NSS surveys. The data is used to generate Table 1 (Urban Panel) Tables 2, columns 3 and 4, Table 3b, and Appendix Table 1, columns 4-6.

Price_data.dta: This dataset contains the price index of items included in the Whole Sale Price index and the tariffs for these items. The unit of observation is item / year. These are used to generate Table 7, Panel B, column 1.

Migration_data.dta: This dataset contains several dummies indicating whether a person has moved based on the 43rd and 55th round of the NSS, Schedule 10. The unit of observation is respondent/survey round. Since the data is used to calculate only means, no respondent identifiers are included. The data is used to generate Table 4.

Indpremia_data.dta: This dataset contains the calculated industry premia for both urban and rural sample of the NSS surveys (see Appendix of the manuscript for more information). The industry identifiers are generated by the author, and account for the change in the industry definition across NSS rounds. The unit of observation is industry / survey round. The data are used to generate Table 7, Panel B, columns 3-4.

Asi_data.dta: This dataset contains basic characteristics of the Indian organized manufacturing sector, as per the Annual Survey of Industries. The unit of observation is industry (NIC 1987) / year. The data are used to generate Table 7, Panel A, and Panel B, column 2.

Agriwage_data.dta: This dataset contains district agricultural data from Esther Duflo, Rohini Pande and Siddharth Sharma (also see Appendix in manuscript). The unit of observation is district (as per the 1961 census) / year. The data are used to generate Table 7, Panel B, column 5.

The stata program **Tables.do** generates all results in the manuscript. Note that the path to the data files in line 21 will need to be changed.
